

Task	Retinotopic Meridian and Eccentricity Localizer
Abbreviation	VISME
Duration (s)	270 (plus 10s reference scans for multi-echo, as “Stay very still” screen shown)
Volume #	270 (6 T1 stabilization + 260 trial + 4 end)
TR (s)	1.00s
Stimuli	<p>Expanding checkerboards, 1 & 2 are alternating black and white, while 3 is random colors (see “Stimuli” below). The expansion is defined by a linear log step to approximate cortical expansion in the visual cortex. Each ring has 36 segments, and the radius of each ring increases in log steps by 0.29 (e.g. ring1=e^0, ring2=$e^{0.29}$, ring3=$e^{0.58}$, etc.). This was calculated out to 36 rings, and then displayed and captured at a resolution of 2560px x 1440px (not all rings were visible at this resolution). The resulting images were then cropped to resolution of 1024px x 1024px around the central point.</p> <p>During the task, each second the checkboard changes 6 times (every 10 frames on a 60Hz projector, ~.166s) in this order: 1-3-2-3-1-2. This repeats every second. This background is then masked by either an image with wedges at the horizontal and vertical meridians, or apertures at various eccentricities (see below). This produces the effect of a checkboard at a given eccentricity or polar angle flickering at 6 Hz. Center fixation dot (.148° diameter) is either fully opaque black ([-1, -1, -1]) or grey ([.76, .76, .76]) (See “Fixation Dot Changes” below).</p> <p>Meridian Masks (All extend from 0.5° - 16.2298° Ecc. Each 1/16th of full polar angle) Horizontal Meridian (H): 354.37° - 5.625° & 174.375° - 185.625° Vertical Meridian (V): 84.375° - 95.625° & 264.375° - 275.625°</p> <p>Eccentricity Apertures (All cover entire 360° polar angle. Calculated along 1.16 log step) Central Aperture (E1): 0.5° - 1.594° Middle Aperture (E2): 1.594° - 5.0878° Peripheral Aperture (E3): 5.0878° - 16.2298°</p>
Display Parameters	Resolution: 1280 x 1024 Viewing Distance: 104cm Screen Width: 43cm Pixels per Visual Degree: 54
Task requirements	Participants are asked to fixate on the central fixation circle, and press with their right index finger every time the fixation dot changes color from black to grey
Other task notes	
# of Runs	5
# of sets	1 set of stimuli, outlined above
Possibility of more sets	Yes, could add more polar angle masks, and change the eccentricity step to include more eccentricity rings.
Design	During the trials, the central dot changes to grey for 400ms at the beginning of a TR (1s) randomly every 1-5 seconds. See exact order for blocks in “Fix Dot Changes” below. At the same time, a given wedge pattern is flickering at 6Hz in blocks of 10s. The ordering of these stimuli is given below in this section.

Stimuli

Checkerboards

In-Scanner Instructions

Dot Detection Task

Watch the central dot. Press with your right index finger whenever the dot brightens.

Keep your eyes focused on only the dot for the entire task, ignore the surrounding checkerboard.
